Enterprise Solution Architecture & Business Deck 2026

Monetize Every API Event. Power Usage-Based Revenue.

MeterFlow bridges high-throughput streaming telemetry directly with automated billing ledgers, calculating complex graduated tiers in Indian Rupees (₹) under 2 milliseconds with zero event loss.

Ingestion Throughput	Median Latency	Idempotency Precision
100,000+ evt/s	< 1.8 ms	99.999%

• COCKPIT TELEMETRY SNAPSHOT LIVE ENGINE

Active Customers	Daily Invoiced
1,480	₹4,82,310

Active Meters	Engine Availability
42 Meters	99.99%

Empowering modern enterprises with high-throughput consumption monetization.

The Shift to Consumption is Breaking Legacy Billing

60%+ of modern software and AI companies are adopting usage pricing, but legacy subscription engines fail under high throughput.

01. INGESTION BOTTLENECKS

High-Throughput Failure

Legacy billing tools choke and lock relational databases when hit with thousands of concurrent API requests and token streams per second.

02. BILLING SURPRISES

Delayed Visibility

End-of-month batch runs cause massive bill shocks for customers, sparking disputes, chargebacks, and catastrophic customer churn.

03. MATHEMATICAL COMPLEXITY

Aggregation Math Limits

Inability to compute sliding 30-day peak concurrency, unique distinct user IDs, or weighted multi-cluster GPU durations natively.

04. IDEMPOTENCY FAILURE

Double-Billing Retries

Network retries and replay requests duplicate billing without distributed idempotency keys, destroying customer trust.

05. DEV OVERHEAD

Brittle Custom Glue Scripts

Engineering teams waste 30%+ of their development sprints maintaining fragile cron jobs connecting application logs to payment gateways.

06. AUDIT VULNERABILITIES

Zero Ledger Traceability

Finance and enterprise compliance teams cannot tie an itemized rupee charged on an invoice back to a verified raw timestamped payload.

Modern businesses cannot run high-scale AI and API products on batch-based legacy billing engines.

What is MeterFlow?

A unified, developer-first consumption metering platform that ingests raw telemetry, executes math instantly, and dispatches audited billing feeds.

PILLAR 01

Sub-Millisecond Ingestion

Stateless event listener accepting over 100,000 events/second with sub-2ms response times and zero queue backlog.

PILLAR 02

Dynamic Mathematical Engine

Out-of-the-box support for SUM, COUNT, MAX, and UNIQUE distinct calculations without custom SQL or map-reduce jobs.

PILLAR 03

Graduated Rate Cards in ₹

Graduated volume pricing, package blocks, minimum commitments, and overage protections tailored for Indian & global markets.

PILLAR 04

Continuous Real-Time Ledger

Live customer balances, margin accruals, and spend limits recalculate continuously within milliseconds of event emission.

PILLAR 05

Automated GST Invoicing

Generate itemized PDF invoices with SAC/HSN codes, automated CGST/SGST/IGST tax calculation, and payment reconciliation.

PILLAR 06

Developer Experience

Interactive API playground, synthetic traffic simulator, and drop-in client SDKs for Node.js, Python, Go, and cURL.

From Event Emission to Settled Invoices in Real Time — One Scalable Platform.

The MeterFlow Enterprise Advantage

Engineered for extreme scale, mathematical precision, and zero-loss reliability under massive workloads.

ZERO EVENT LOSS GUARANTEED

99.999%

Cryptographic Idempotency Guard

Every incoming event emission is verified against distributed Redis hashes. Duplicate webhooks, network retries, and replay attacks are rejected instantly with zero erroneous charges.

✓ Stress-tested at 500,000 burst events

Real-Time Margin Protection

Set dynamic budget thresholds and automated webhook alerts before customer overages become uncollectable debt.

Multi-Model Monetization

Support prepaid credits, postpaid graduated tiers, and hybrid platform subscriptions in a single unified ledger.

Granular Cryptographic Audit

Trace every single rupee charged on an invoice back to raw timestamped JSON payloads and unique event IDs.

High Availability & SLA

99.99% uptime guarantee with multi-zone active redundancy in ap-south-1 Mumbai and zero single point of failure.

Bringing together high-throughput streaming telemetry and bulletproof revenue accounting in a single ecosystem.

High-Throughput Technical Architecture

Clean MVC separation, asynchronous queueing, and stateless aggregation processors engineered for sub-2ms latency.

TIER 01 Edge Sources

Client Ingestion

REST POST /api/v1/events, Webhooks, Python/Node/Go SDKs, streaming telemetry from apps and cloud clusters.

TIER 02 < 2ms Latency

Listener Gateway

Stateless rate-limiting, bearer token auth, schema validation, and distributed Redis idempotency cache deduplication.

TIER 03 Real-Time Math

Metering Engine

Sliding window aggregators, SUM/COUNT/MAX rules, tier rate card evaluation, and instantaneous ledger recalculation.

TIER 04 Settlement

Invoicing & ERP Feeds

Transactional MongoDB ledger, GST PDF invoice generator, automated webhook dispatcher to Stripe, Razorpay & NetSuite.

Ingestion Benchmark:	142,500 evt/s Horizontal Capacity	1.2ms Ingestion Worker Latency	Zero Dropped Packets Under Load

Engineered for sub-2ms processing latency and linear horizontal scalability.

Arbitrarily Complex Consumption Math at Scale

Define any billing metric without writing custom map-reduce jobs or database triggers.

FORMULA 01 SUM

Cumulative Total

LLM Prompt/Completion Tokens, Storage GB-Hours, Transaction Volume in ₹, or bytes transferred over CDN.

FORMULA 02 COUNT

Discrete Occurrence

API Calls executed, Webhooks delivered, SMS notifications sent, or database queries evaluated.

FORMULA 03 MAX

Peak Utilization

Peak concurrent seats, highest RAM allocation, peak bandwidth spike, or active channel capacity in a cycle.

FORMULA 04 UNIQUE

Distinct Cardinality

Distinct monthly active user IDs (MAU), unique visited tenant domains, unique customer IP addresses.

FORMULA 05 WEIGHTED_DURATION

Time × Multiplier

GPU cluster compute seconds multiplied by hardware class coefficient (e.g. Nvidia A100 vs H100 GPU tiers).

FORMULA 06 RATE_WINDOW

Throughput Bursts

Price dynamic traffic bursts over rolling 60-second sliding windows to penalize abusive traffic spikes.

If your system can emit an event, MeterFlow can meter, aggregate, and price it instantly.

Sophisticated Monetization Models in INR (₹)

Empower your product team to launch and iterate on revenue models without touching backend code.

Graduated Tier Pricing

Volume Discount

Customers pay descending unit prices as their volume grows, incentivizing scale without price shocks.

```
Tier 1: ₹0.05 (1-100k) • Tier 2: ₹0.03 (100k-1M) • Tier 3: ₹0.015 (1M+)
```

Pre-Purchased Volume Blocks

Package Commit

Upfront cash collection with automatic overage buffers to prevent service interruption.

```
₹4,999 for 500,000 API requests • Overage at ₹0.012 per extra request
```

Platform Base Fee + Overage

Hybrid SaaS

Guarantees recurring baseline revenue while retaining uncapped upside from high-usage enterprise customers.

```
₹2,499/mo base subscription includes 50,000 events + metered delta
```

Prepaid Wallet Drawdown

Drawdown Ledger

Zero payment default risk with automated notifications when customer balance drops below 20%.

```
Customer tops up ₹50,000 wallet • Metered consumption auto-draws live
```

Empower your product team to launch new pricing plans in minutes without backend code deployments.

Automated Invoicing & ERP Financial Feeds

Eliminate billing surprises and streamline reconciliation with automated, auditable GST invoices.

01. CADENCE AUTOMATION

Flexible Billing Cycles

Trigger invoices automatically on monthly anniversary dates, calendar month-ends, or budget threshold spikes.

02. TRANSPARENCY

Itemized Line Items

Break down every single meter with exact volume consumed, tier brackets applied, and net rupee totals.

03. TAX COMPLIANCE

Indian GST Support

Full compliance with HSN/SAC codes, automatic CGST, SGST, IGST calculations and formal tax receipts.

04. REAL-TIME BROADCAST

Webhook Event Feeds

Real-time HTTP webhooks broadcast invoice.created, invoice.paid, and threshold.breached events to external services.

05. FINANCIAL SYNC

Direct ERP Feeds

Turnkey ledger sync into Stripe, Razorpay, NetSuite, Zoho Books, Tally, and QuickBooks.

06. SELF-SERVE

Customer Usage Portal

Give tenants live visibility into current accruals, budget limits, and on-demand PDF receipts.

Eliminate billing surprises and streamline reconciliation with automated, auditable invoices.

Built for Developers, Trusted by Finance

Integrate your first consumption meter and start streaming live telemetry in under 5 minutes.

Interactive API Playground

Execute live POST /api/v1/events and benchmark server latency directly inside the browser.

Synthetic Traffic Simulator

Simulate burst traffic with 100 to 1,000 mixed events to stress-test your rate curves.

Drop-in Language SDKs

Official drop-in SDKs for Node.js, Python, Go, Java, and raw REST webhooks.

```
// Ingest streaming consumption in 3 lines of code
import { MeterFlow } from '@meterflow/sdk';
const client = new MeterFlow({ apiKey:
'mf_live_sec_8f93e2b...' });

// Stream telemetry event
await client.events.emit({
  customerId: 'cust_enterprise_01',
  meterType: 'api_tokens',
  quantity: 250,
  idempotencyKey: 'evt_981a8b2',
  metadata: { region: 'ap-south-1' }
});
```

Zero steep learning curves: start streaming events with 3 lines of code.

Smooth 5-Step Customer Onboarding Journey

A structured, frictionless journey from sandbox evaluation to production scale inspired by Ricoz franchise models.

01

Connect & Org Setup

Establish tenant boundaries, configure ledger currency in INR (₹), and issue bearer secrets.

02

Define Meter Rules

Select mathematical formula (SUM, COUNT, MAX, UNIQUE) and property keys to aggregate.

03

Configure Rate Cards

Establish graduated volume brackets, package blocks, and minimum billing rules in INR (₹).

04

Simulate & Benchmark

Run synthetic traffic bursts to stress-test your rate curves and verify calculation latency.

05

Go Live & Scale

Switch to live production traffic with automated GST invoices and ERP webhook feeds.

Implementation Timelines: **Sandbox Setup: < 5 Minutes** **Production Testing: 1 Business Day** **Enterprise Cluster: 48 Hours**

From initial signup to first live metered invoice in less than 24 hours.

Commercial Partnership & Investment Model

Predictable, transparent unit economics natively priced in Indian Rupees (₹) with zero hidden fees.

DEVELOPER SANDBOX

₹0

Free Forever for Prototypes

- ✓ 100,000 events / month
- ✓ 3 Active Meters
- ✓ Standard SUM & COUNT
- ✓ API Playground Access
- ✓ Community GitHub Support

GROWTH PARTNER

MOST POPULAR

₹9,999

per month for scaling SaaS

- ✓ 5,000,000 events / month
- ✓ Unlimited Consumption Meters
- ✓ All Math (MAX, UNIQUE, WEIGHTED)
- ✓ Automated GST Invoicing & Feeds
- ✓ Overages at ₹0.002 / event

ENTERPRISE SCALE

₹49,999

per month for high-throughput

- ✓ 50,000,000+ events / month
- ✓ Dedicated VPC Ingestion Cluster
- ✓ Custom NetSuite / SAP Connectors
- ✓ 99.999% Zero-Loss SLA
- ✓ 24/7 Dedicated Architect

100% transparent pricing — zero hidden setup fees and no surprise platform charges.

Meet the Team & Begin Onboarding

Backed by distributed systems engineers and fintech billing strategists committed to your revenue success.

SS

Shubham Singh

Lead Architect & CEO

Tech Systems Lead

Driving high-throughput metering infrastructure with startup agility and distributed systems rigor.

AM

Arjun Mehta

VP of Distributed Infrastructure

Ex-Streaming Architect

Specialist in low-latency event listeners, distributed Redis caching, and zero-loss queuing.

PS

Priyanka Sharma

Head of Billing & Compliance

Fintech Billing Strategist

Oversees Indian GST automated tax reconciliation, multi-tenant auditing, and enterprise ERP integrations.
